

## Sample attrition

Each row shows how many country-years remain after one filter

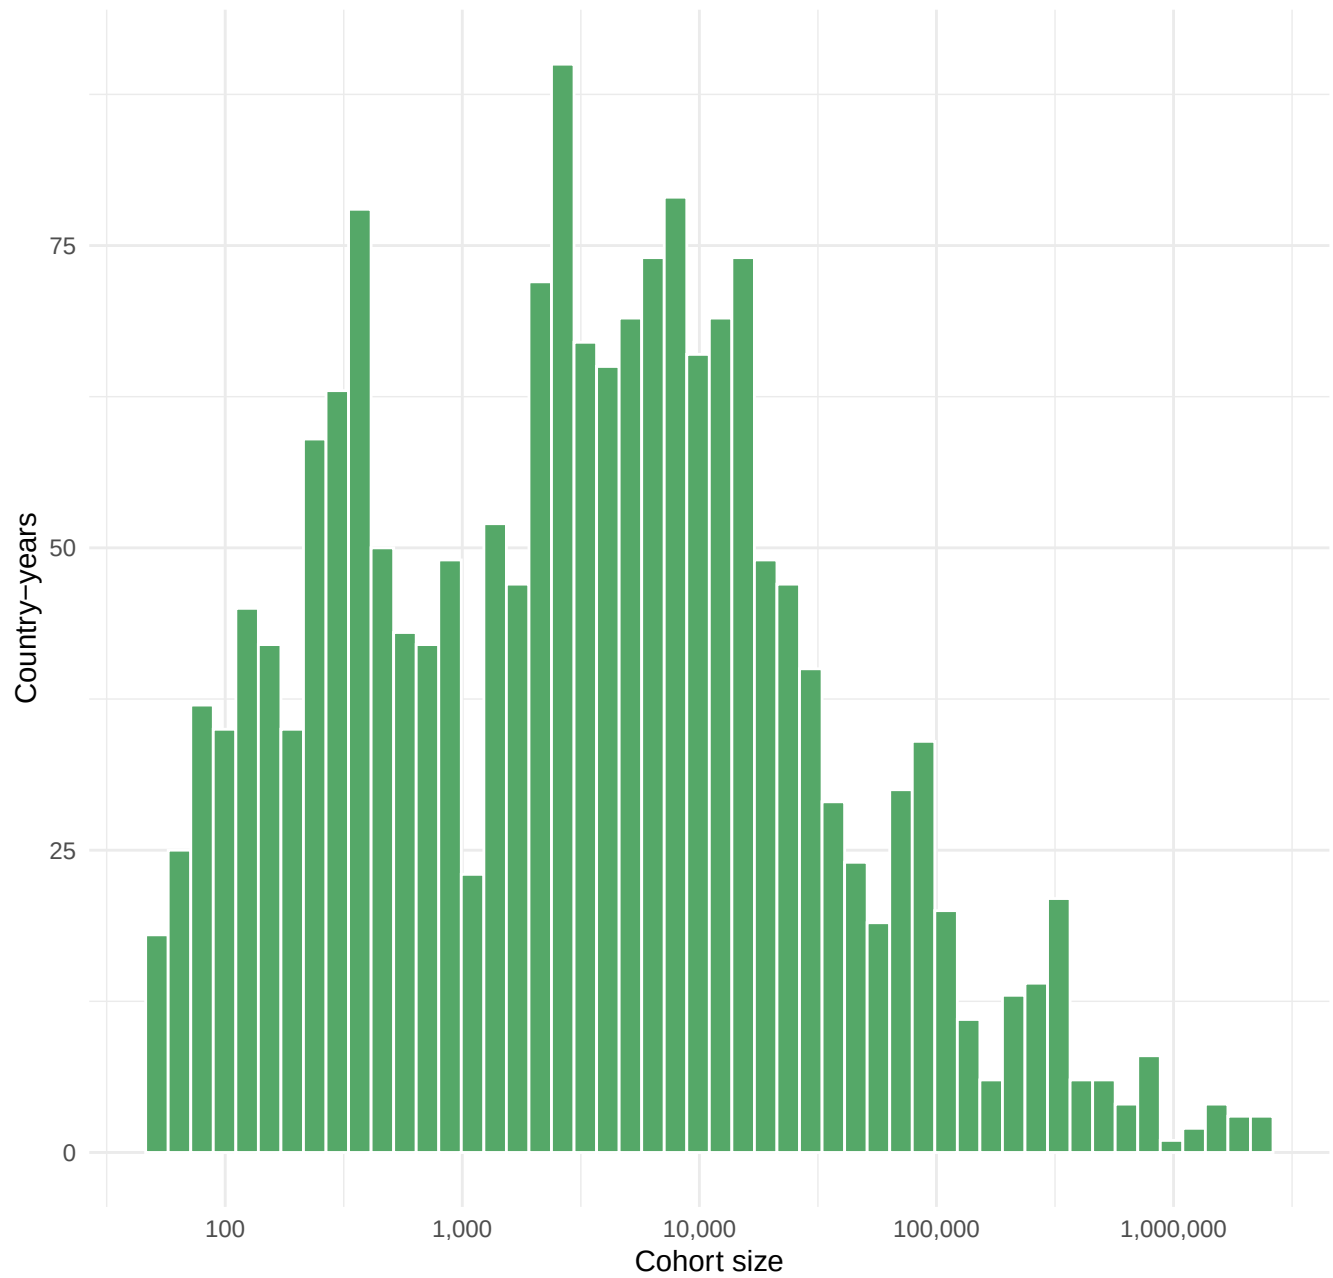

# Distribution of treatment success rate

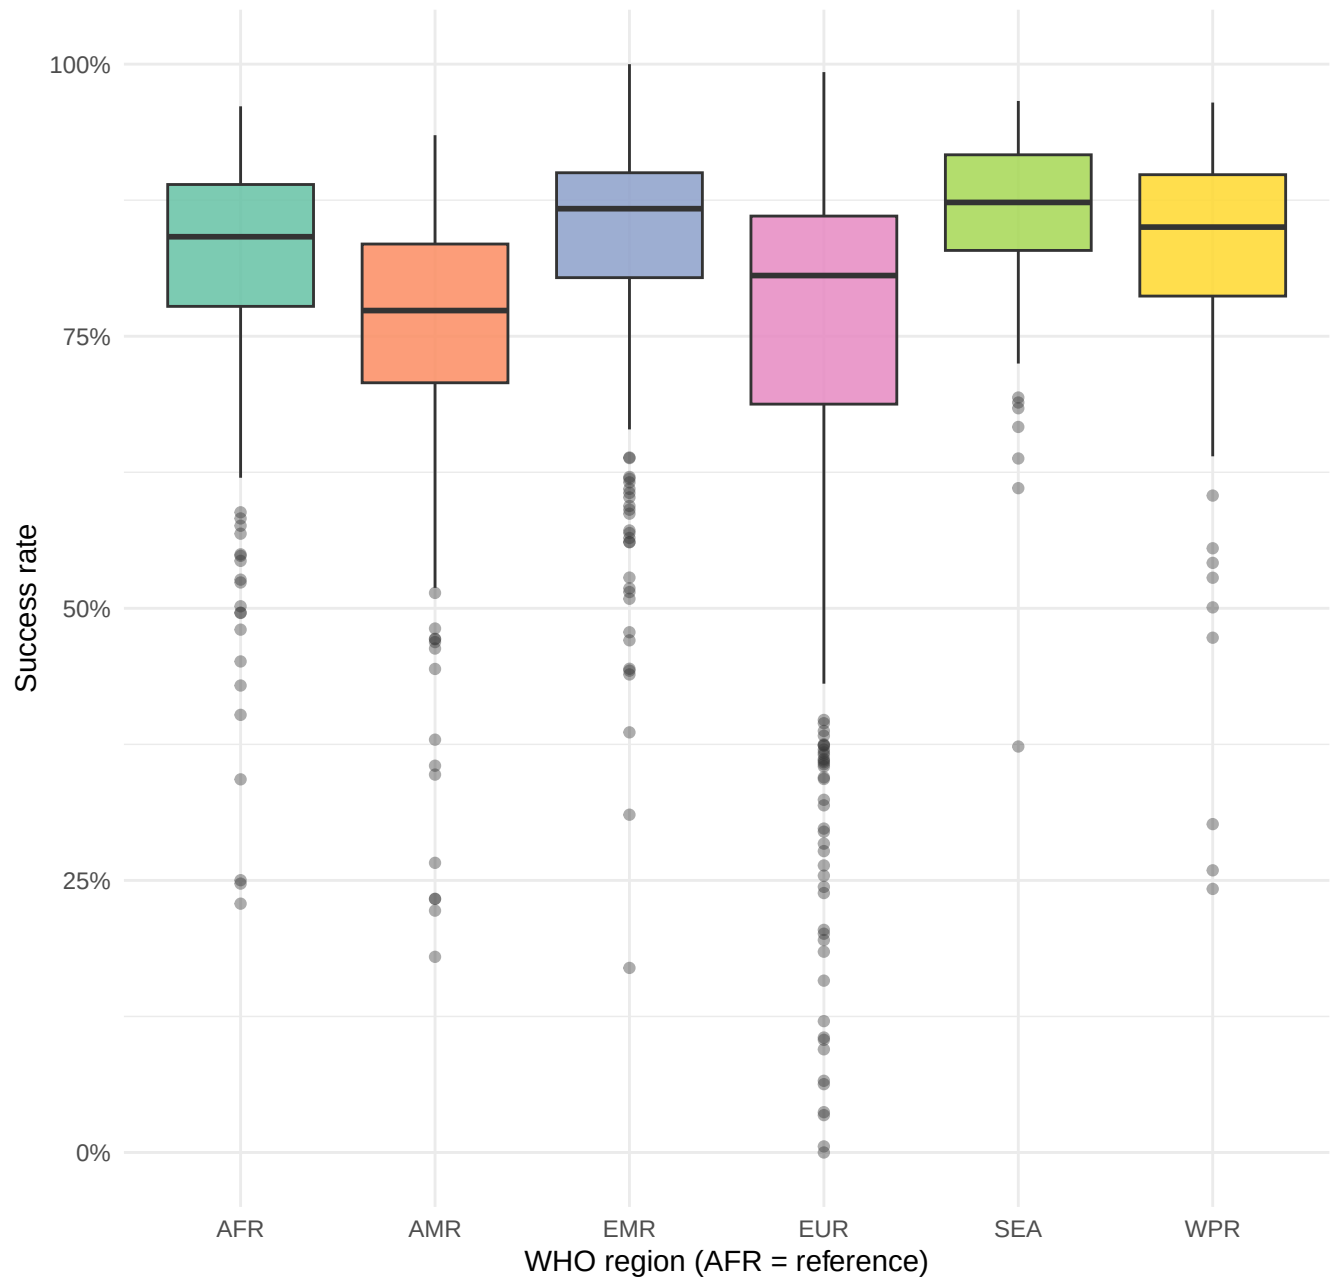

success / cohort, locked analysis sample (n = 1,862)

**Cohort size distribution (log10 x-axis)**

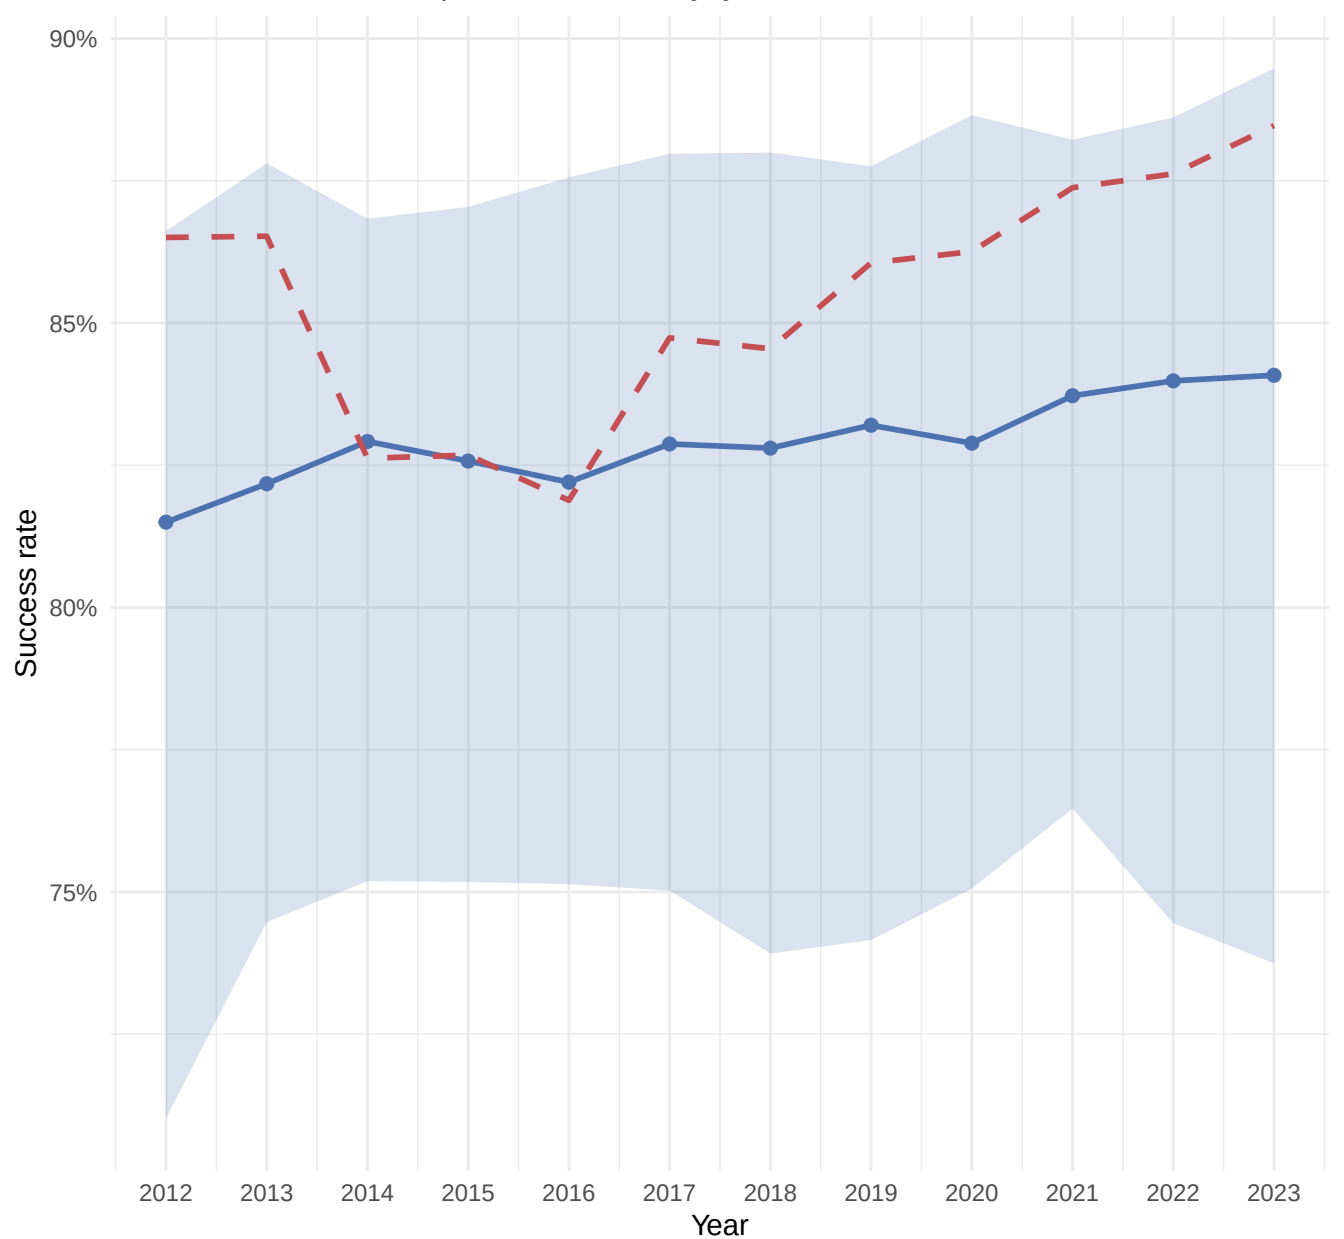

**Success rate by WHO region**

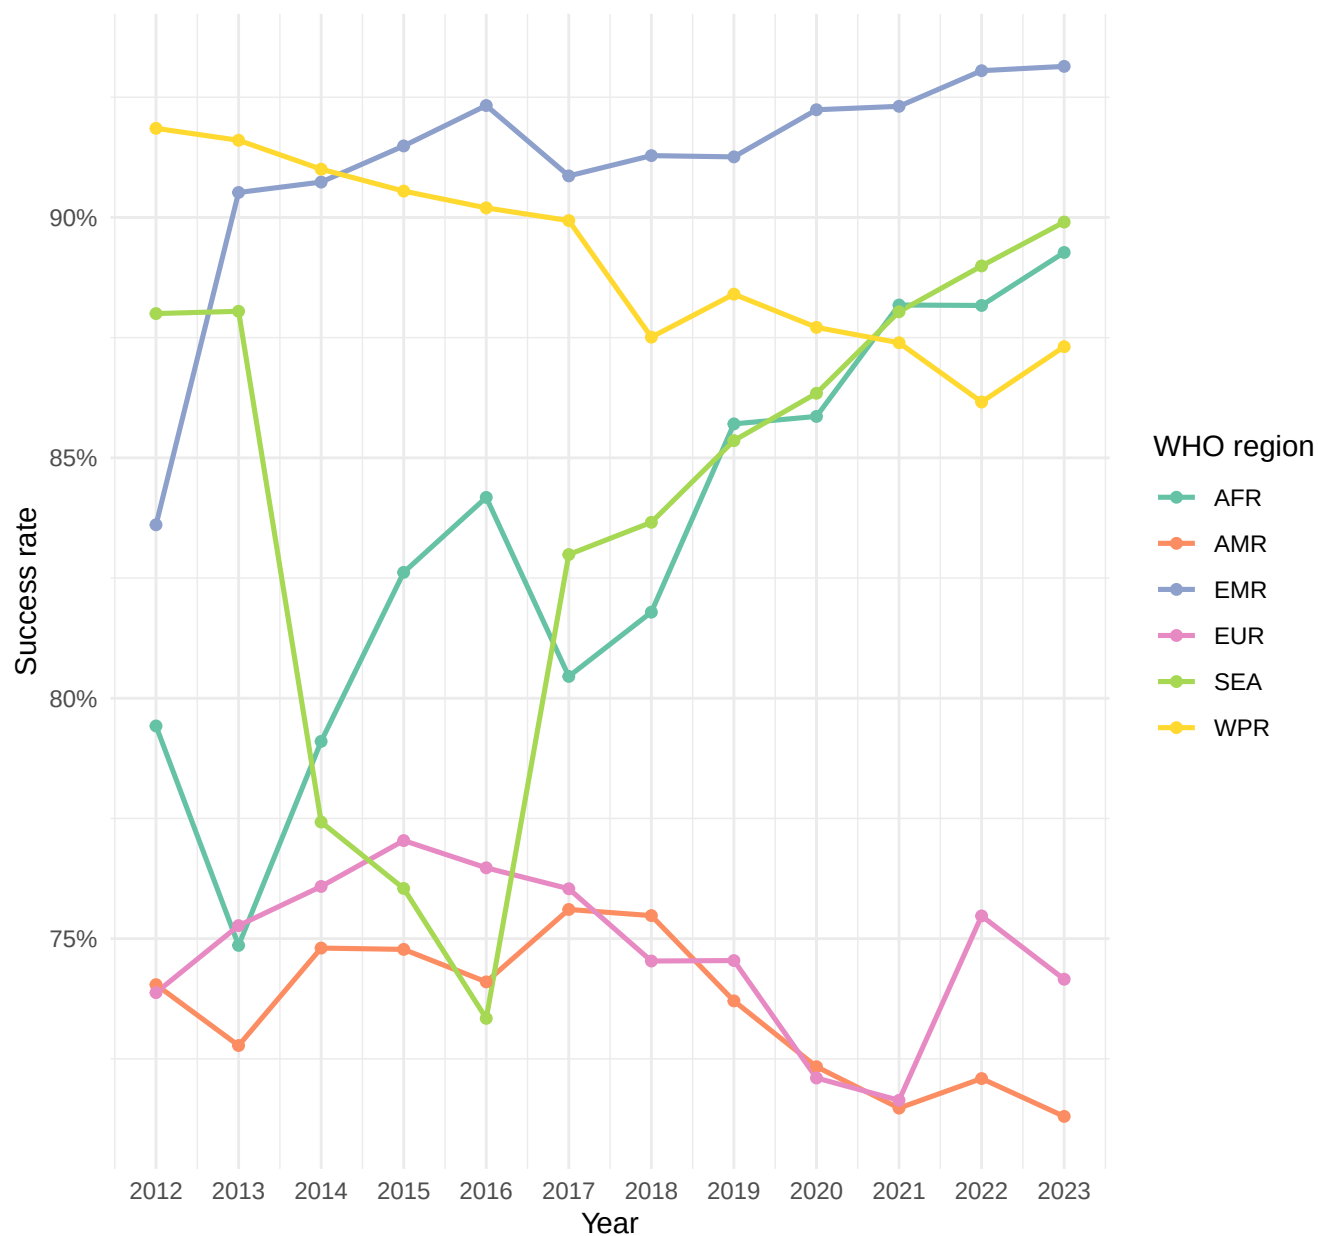

# Yearly success rate: country-year median (blue) vs cohort-weighted global

Shaded band: 25th–75th percentile of country-year rates

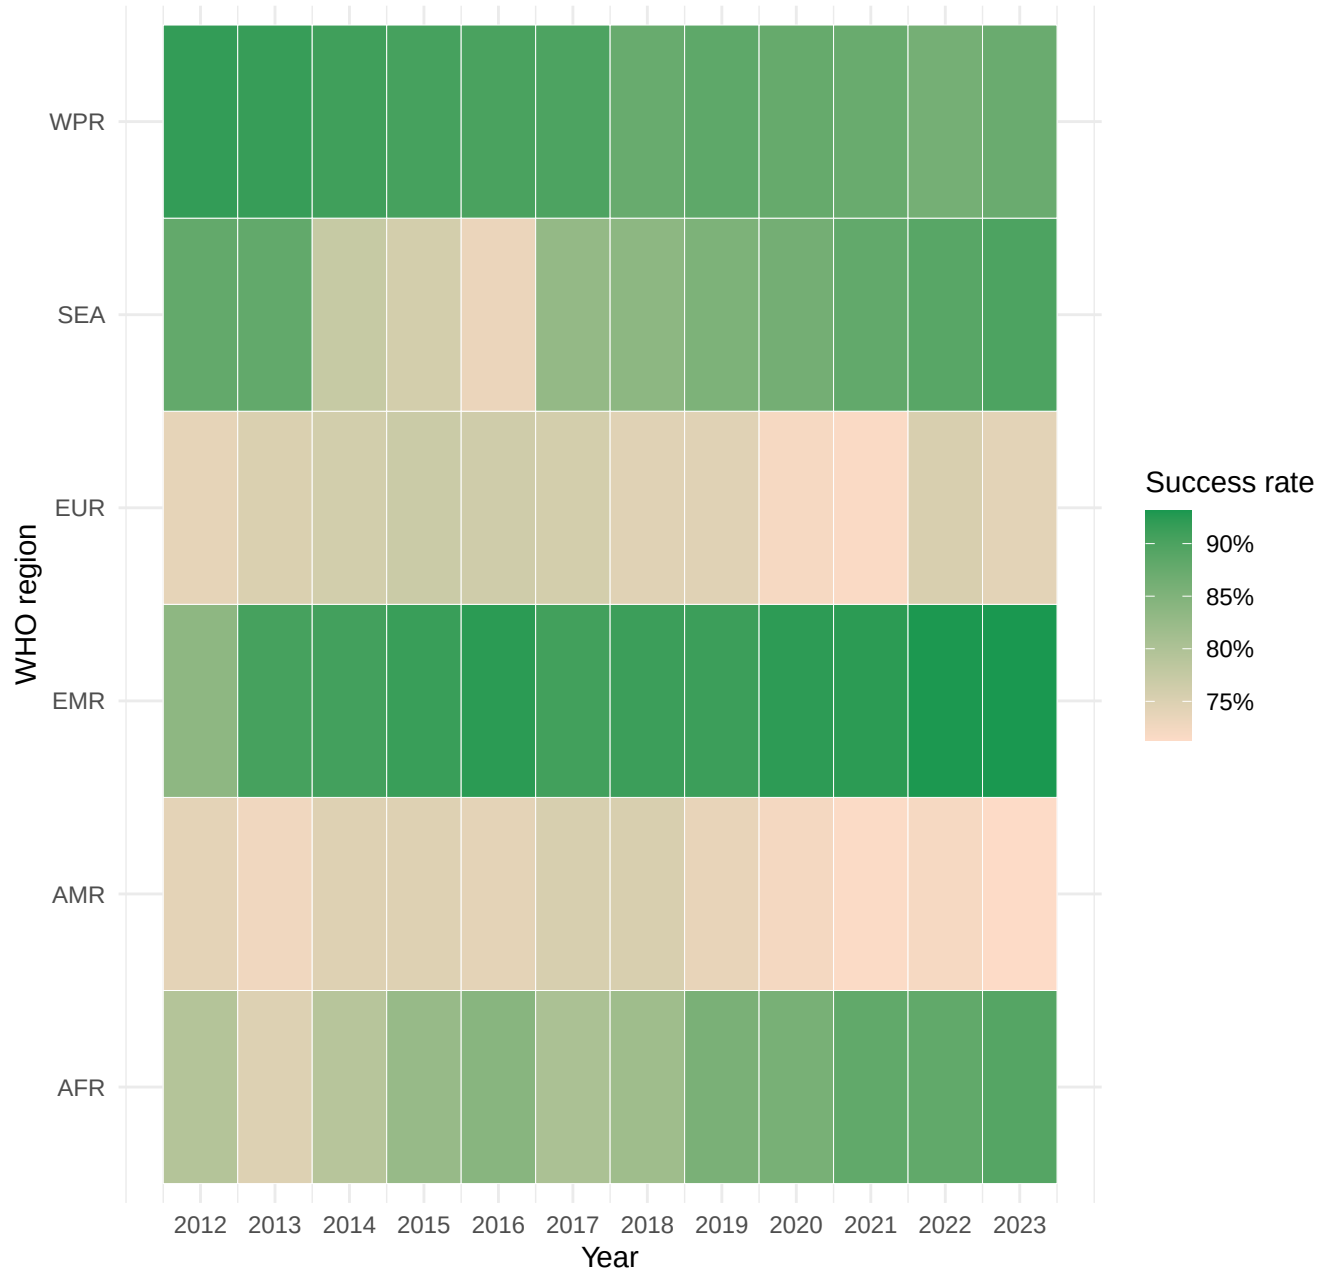

# Temporal trend by WHO region

Cohort-weighted regional success rate per year

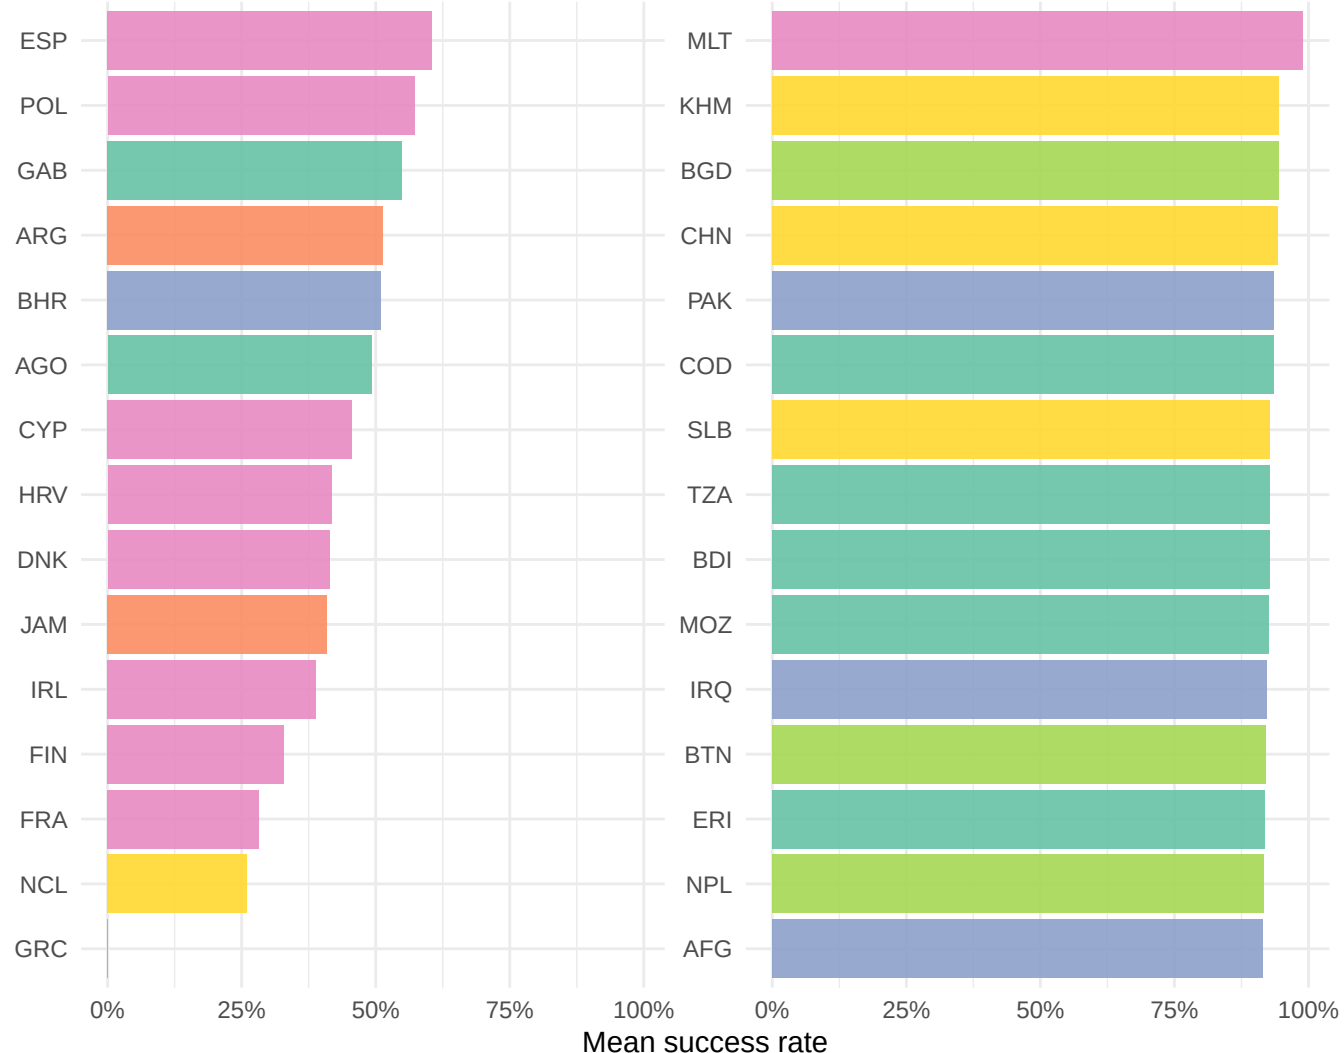

### Region-year mean success rate

# Top and bottom 15 countries by mean success rate (2012–2023)

Bottom 15 (lowest mean success)

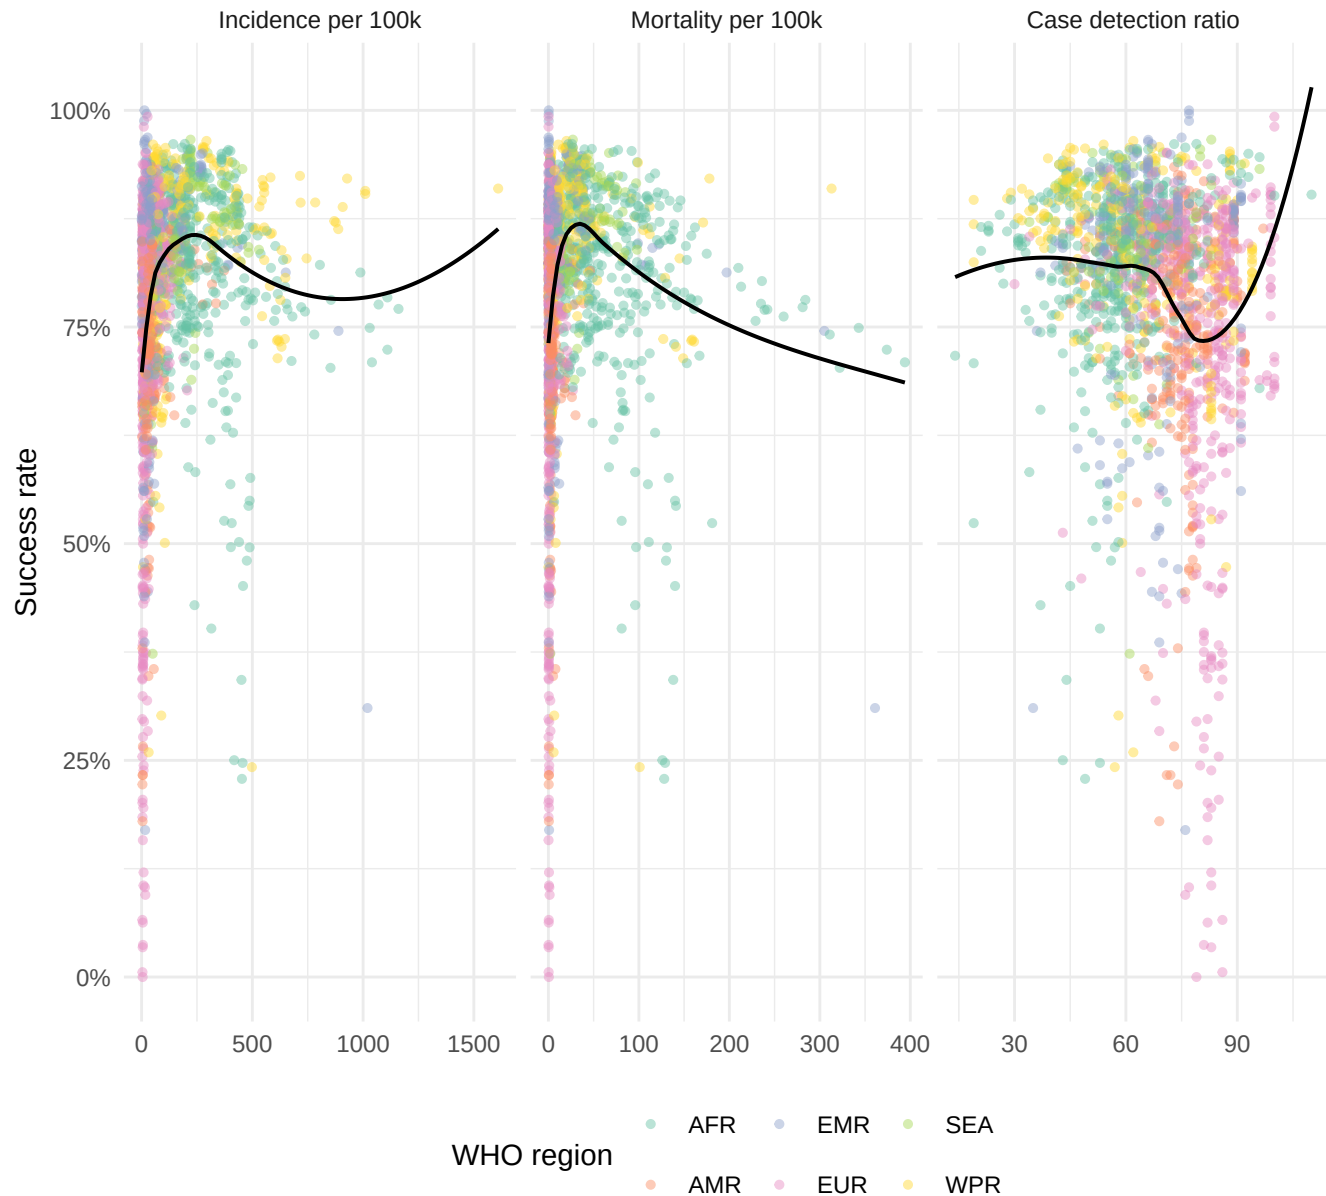

Top 15 (highest mean success)

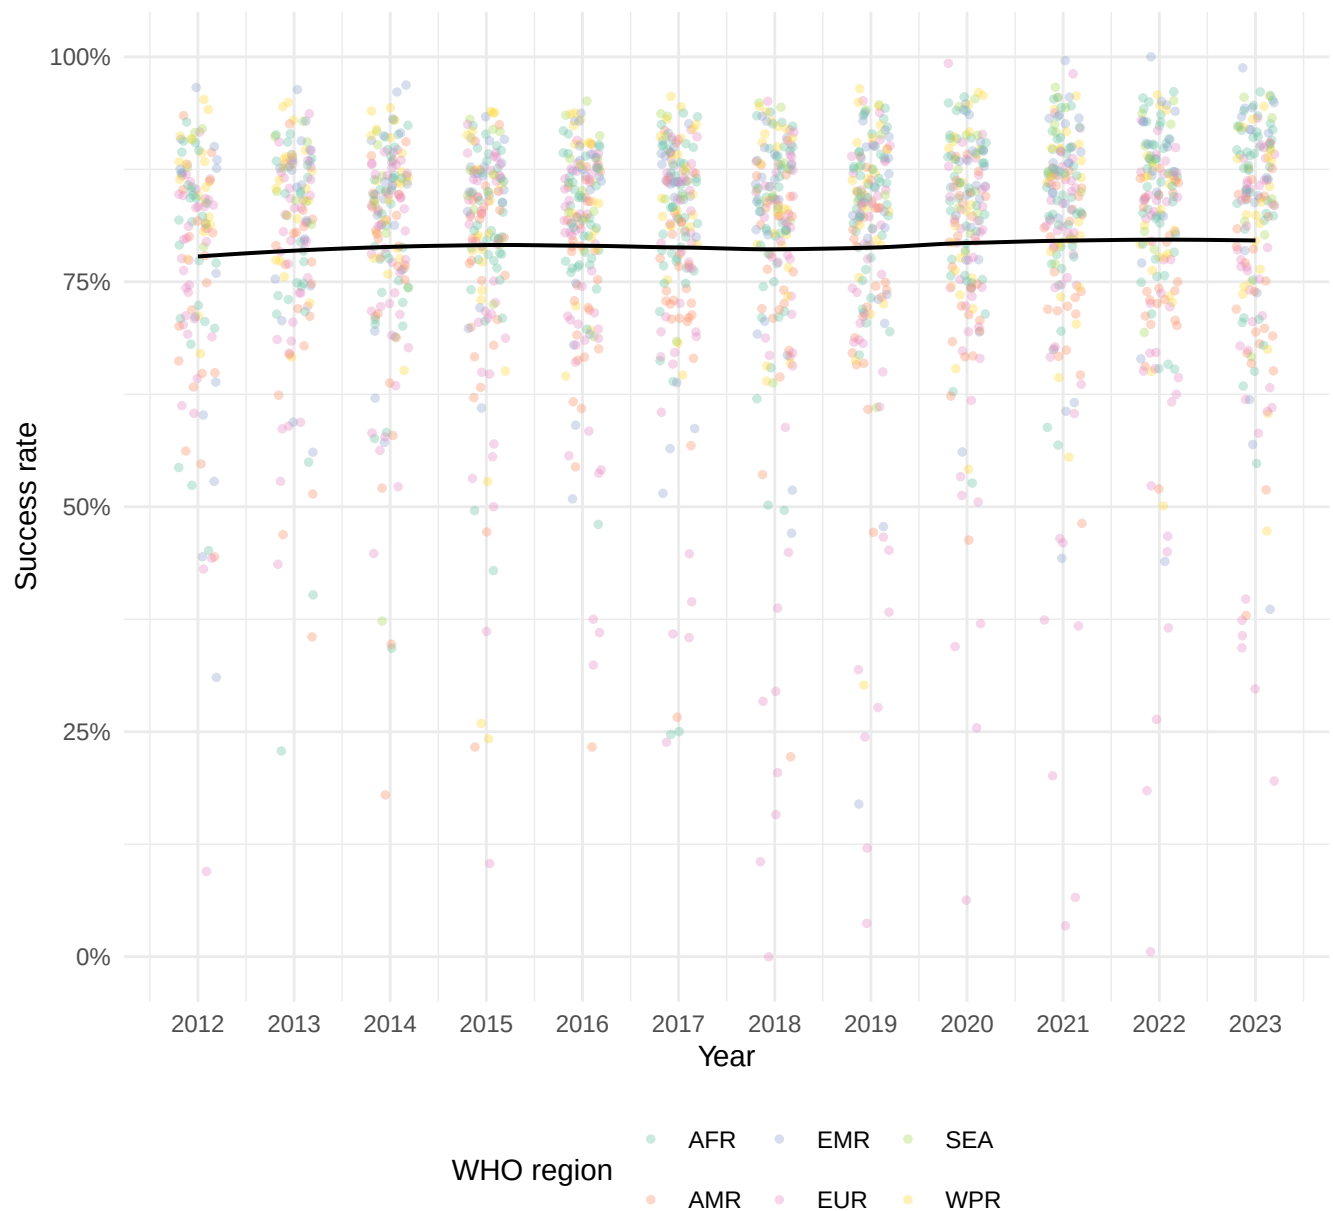

# Burden predictors vs treatment success

Each point is one country-year; black line is a loess trend

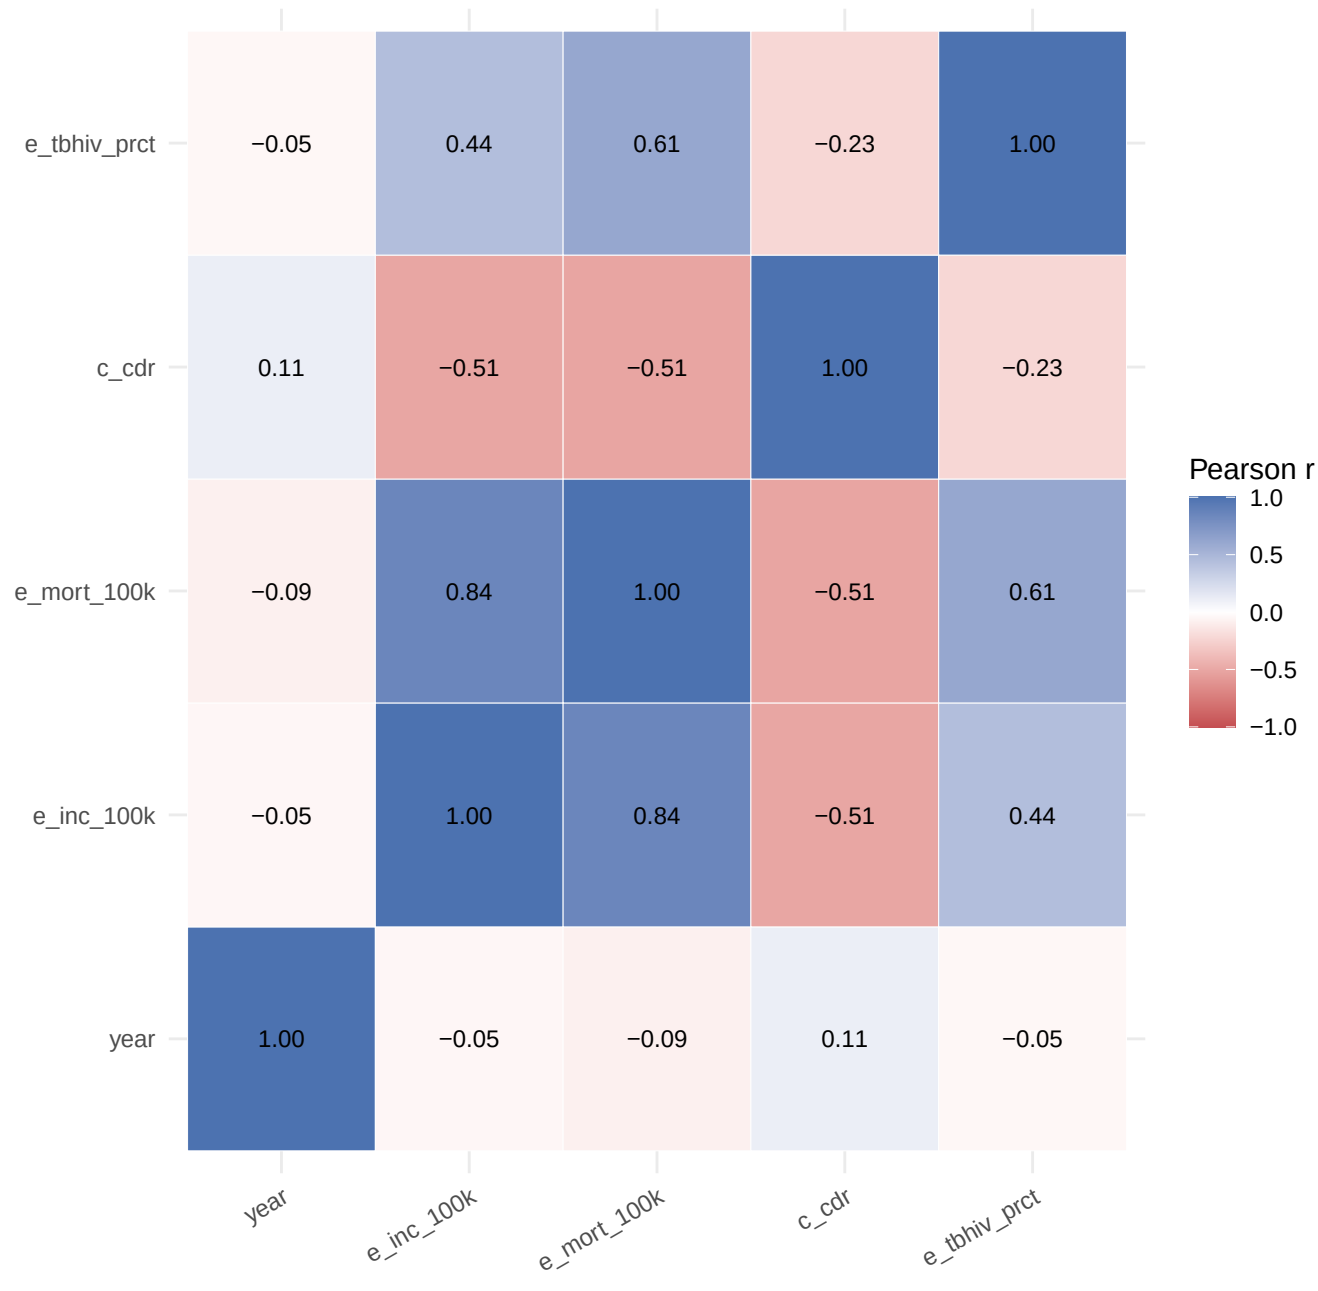

# Treatment success across years

Country-year points with overall loess trend

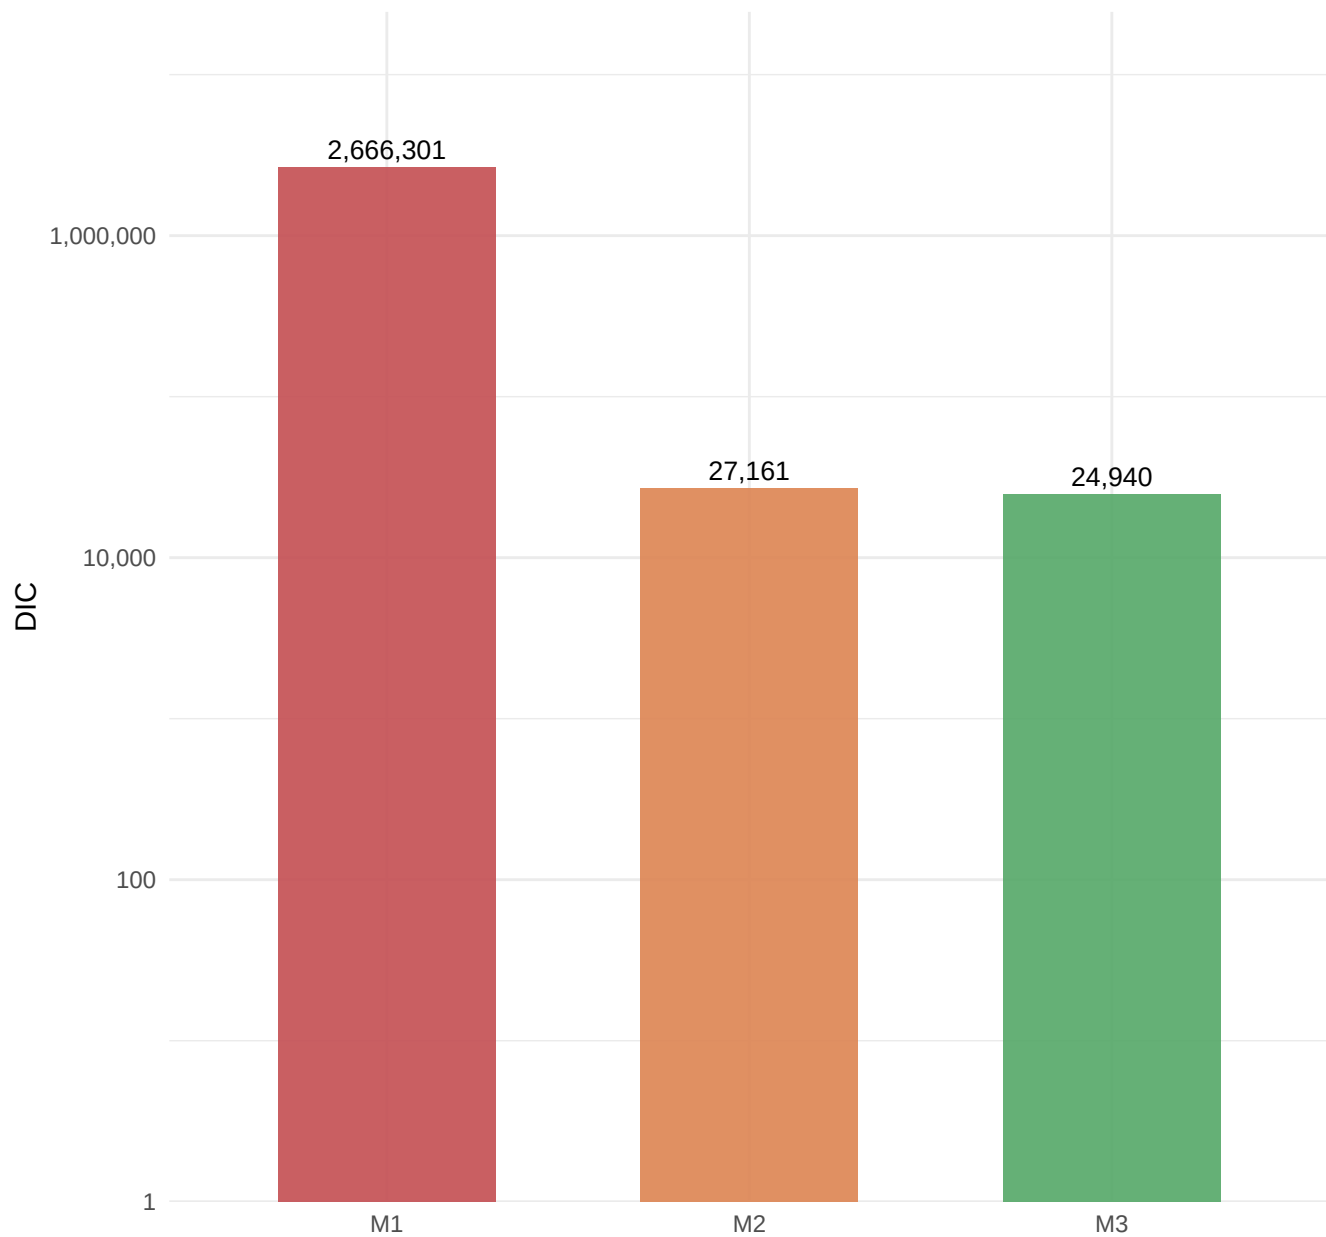

**Predictor correlation matrix**

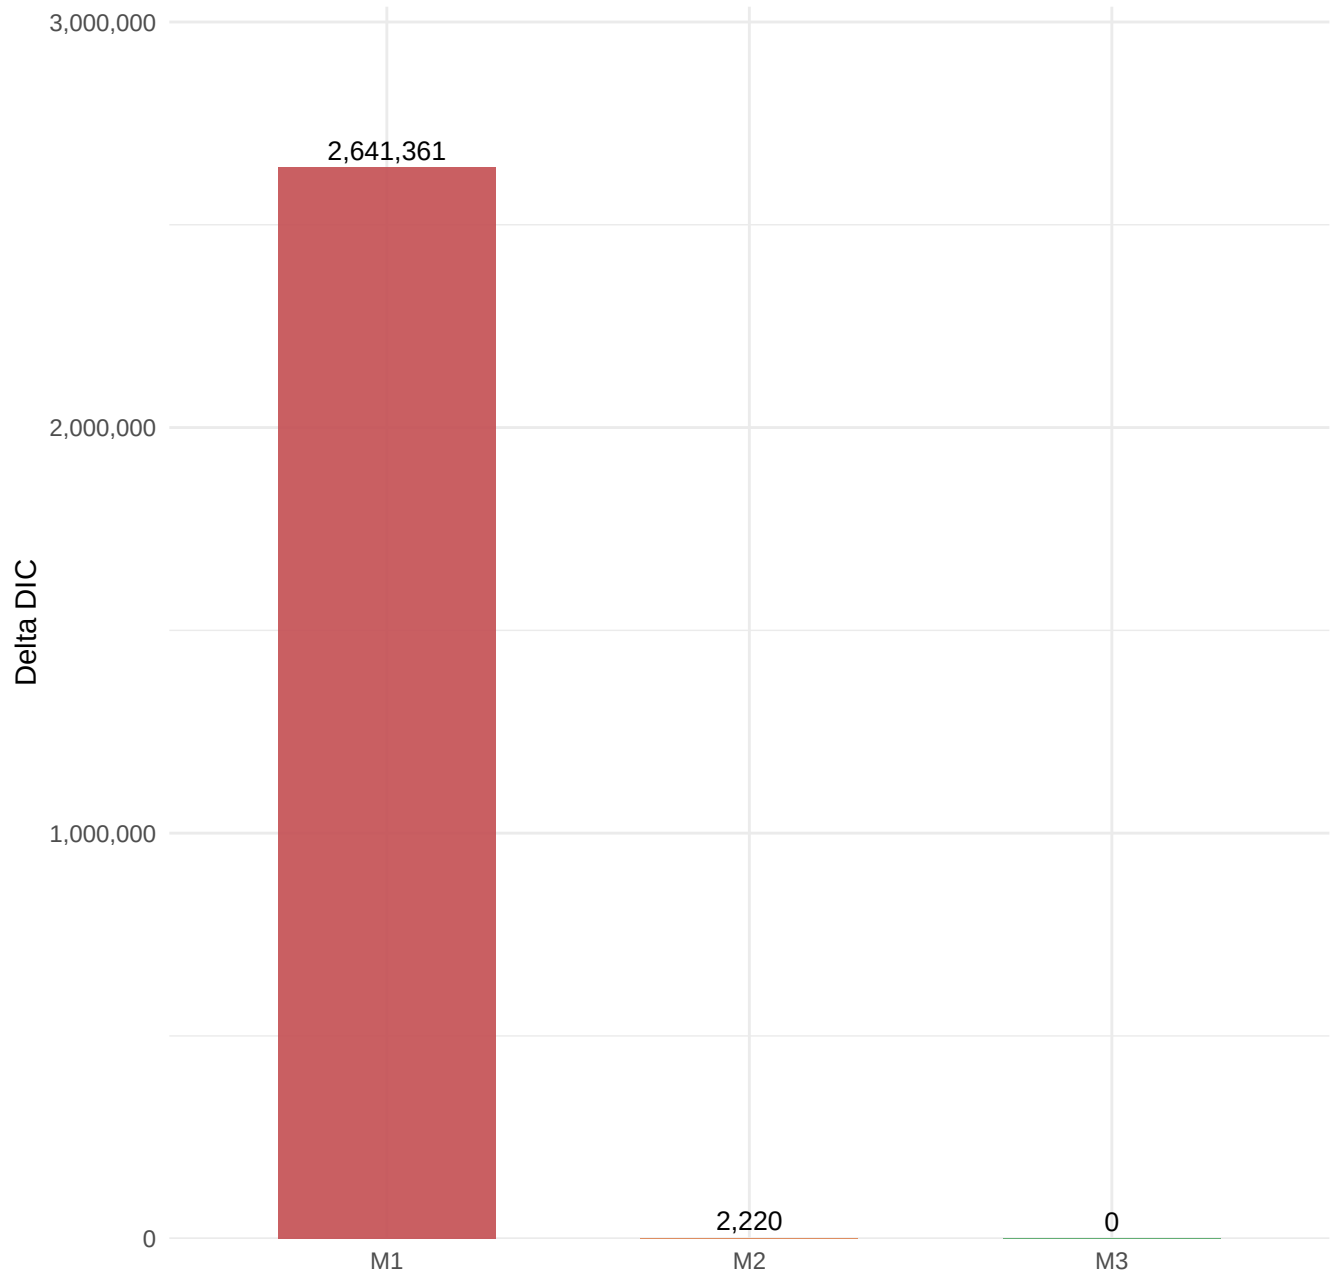

## DIC across models (log10 scale)

M1 is severely inadequate; M3 has the lowest DIC

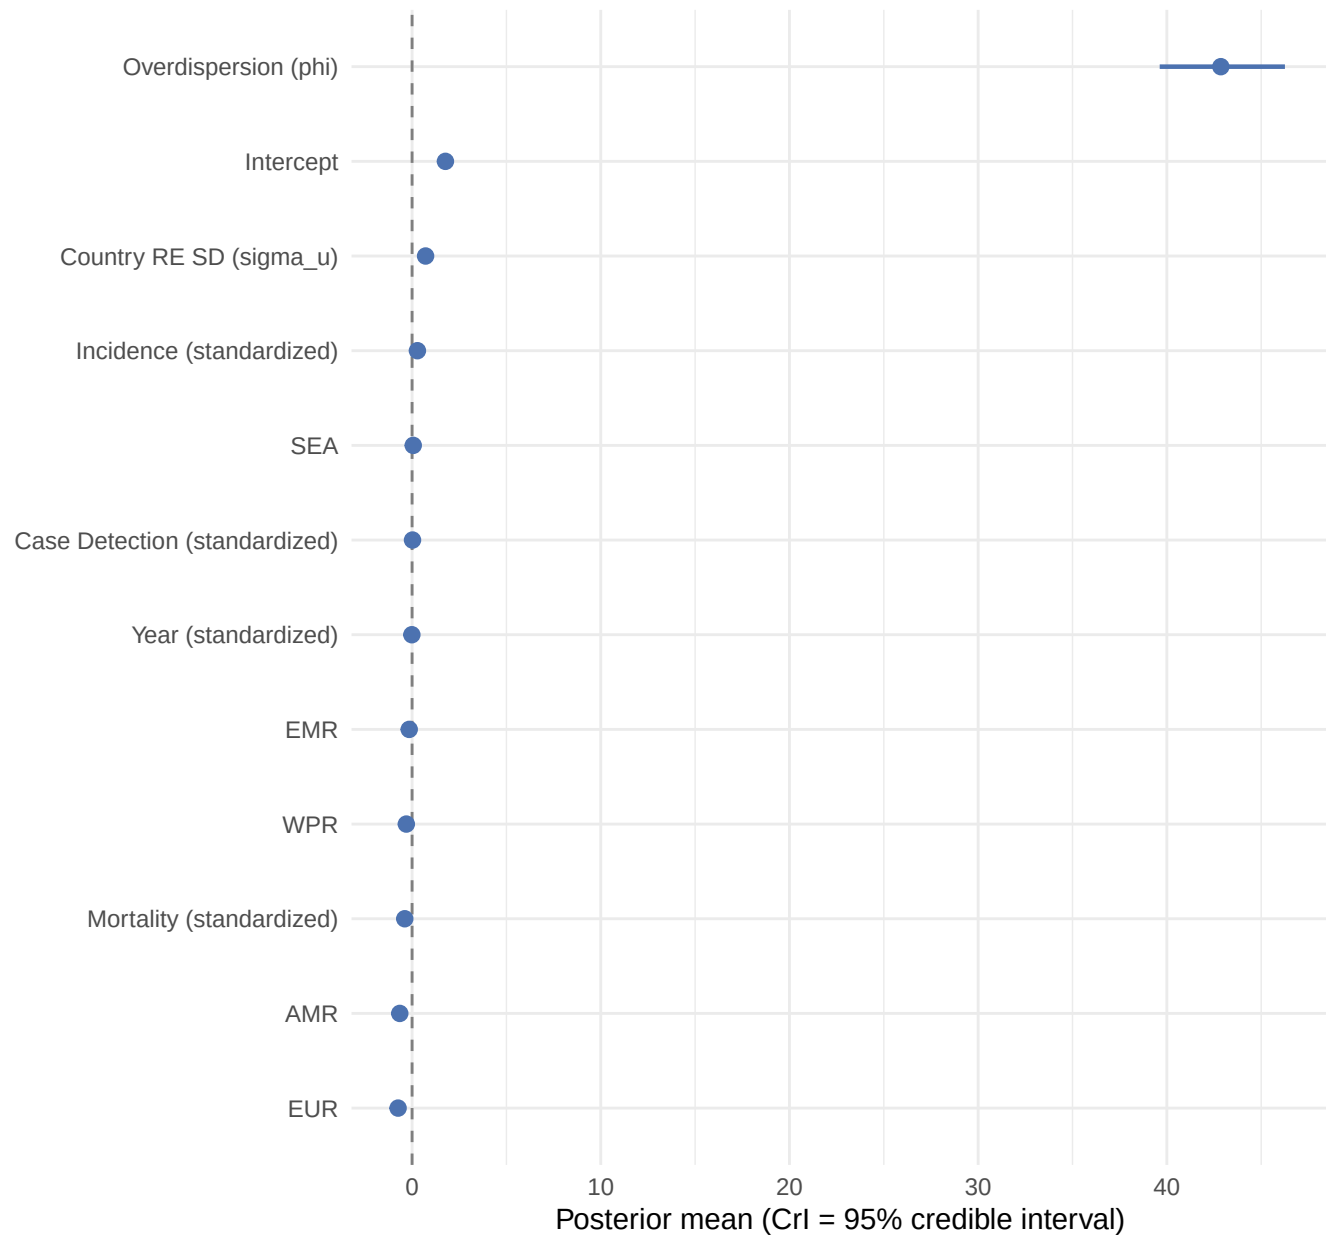

**Delta DIC relative to the preferred model (M3)**

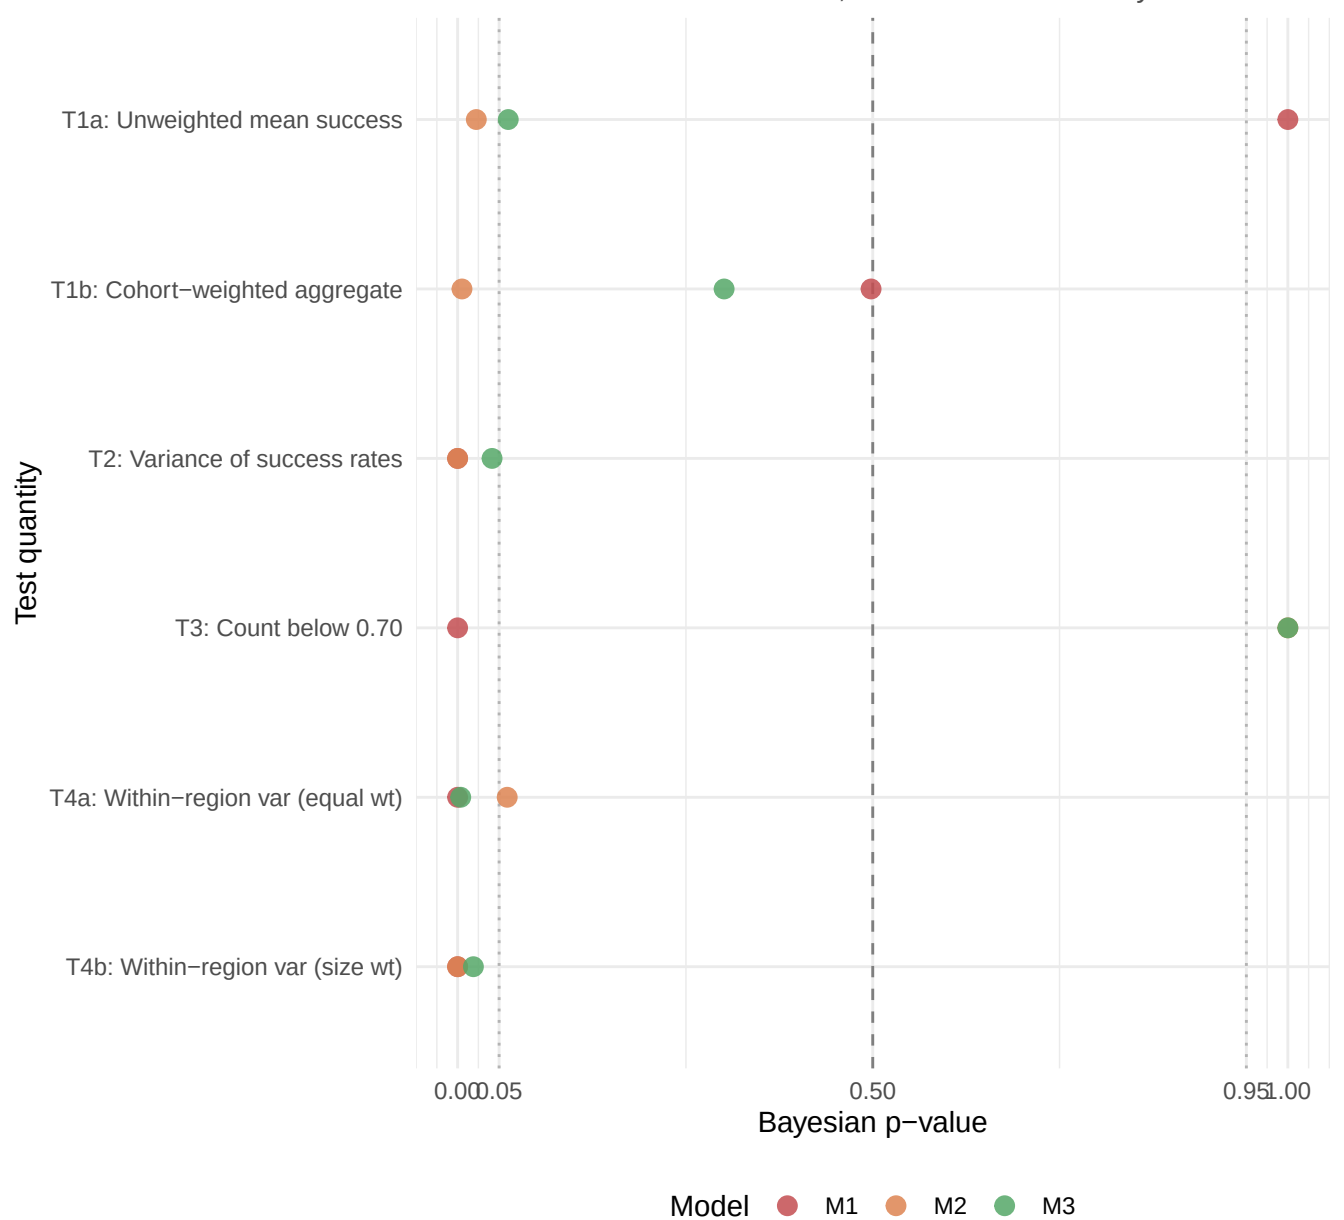

# M3 posterior means with 95% credible intervals

Hierarchical beta-binomial model (logit scale)

# Posterior predictive Bayesian p-values

Values near 0.5 = well calibrated; values near 0 or 1 = systematic mismatch

**Observed vs posterior predictive mean per PPC statistic**
